

Reference : GEV on systematic data 1970-2020

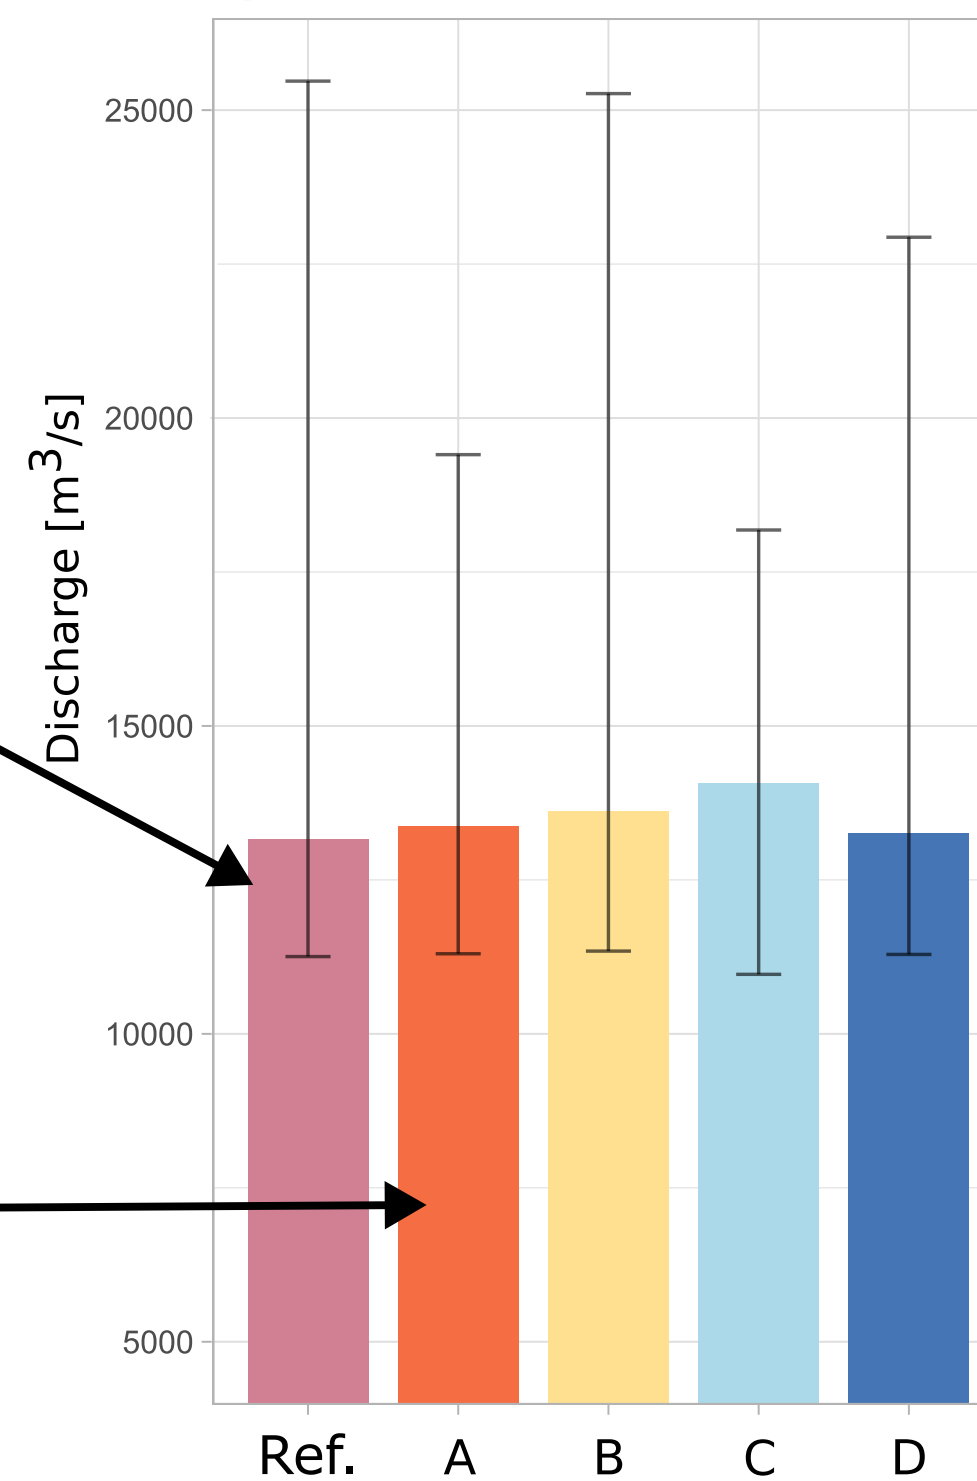

Mixed model A (known threshold S and start of hist. period t^*) :

- systematic data 1970-2020
- over threshold floods : 1816-1969

Q1000

Inclusion of historical floods reduces the uncertainty of flood quantiles even if only the number of exceedances on S is known (Reference vs model D)

Ignoring threshold uncertainty leads to underestimate flood quantiles uncertainty (models A & C vs models B & D)
